

Allegheny Viburnum
Viburnum x rhytidophylloides

Height: 8'-10'
Width: 8'-10'
(At Maturity)
Growth Rate: Fast
USDA Zone: 4-8
Bloom: White
Time: May
Sun: Full/partial
Water: Low

This is a large shrub that is semi evergreen. Its leaves are dark green, leathery and can be up to 6 inches long. It produces flat panicles of creamy white flowers in spring. These produce a cluster of berries that first appear bright red then change to a glossy black. It is not unusual to find both colors of fruit together and they are a popular food source for birds.

This shrub will adapt to poor, dry, compact, soils and tolerates a wide range of pH levels. It will grow best in moist to average well drained soils. It is drought, pollution and heat tolerant which makes this a good choice for the urban environment. If pruning is required it should be completed immediately after flowering.
